Why restraints: Two atoms, ideal case

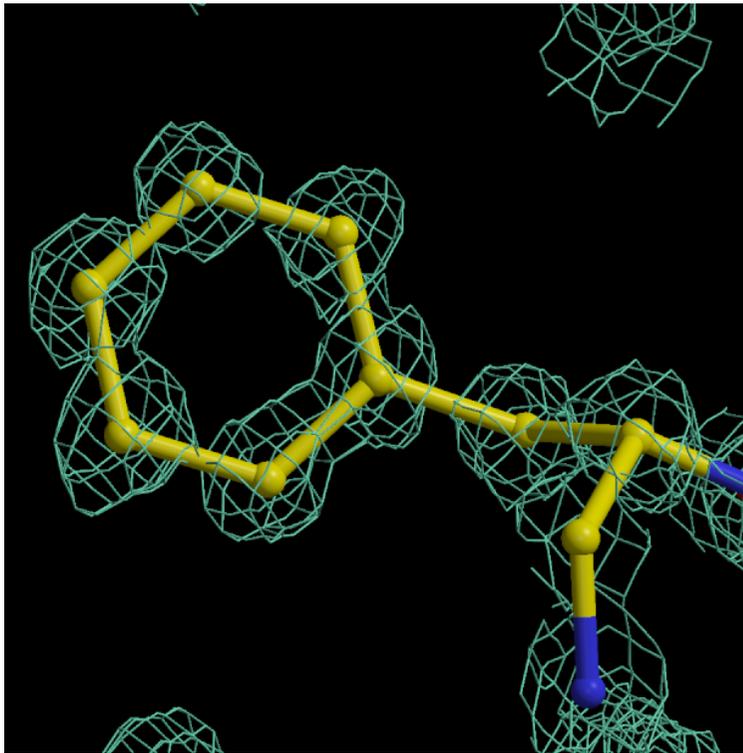

- Distance between atoms 1.3Å. B values 20 and 50

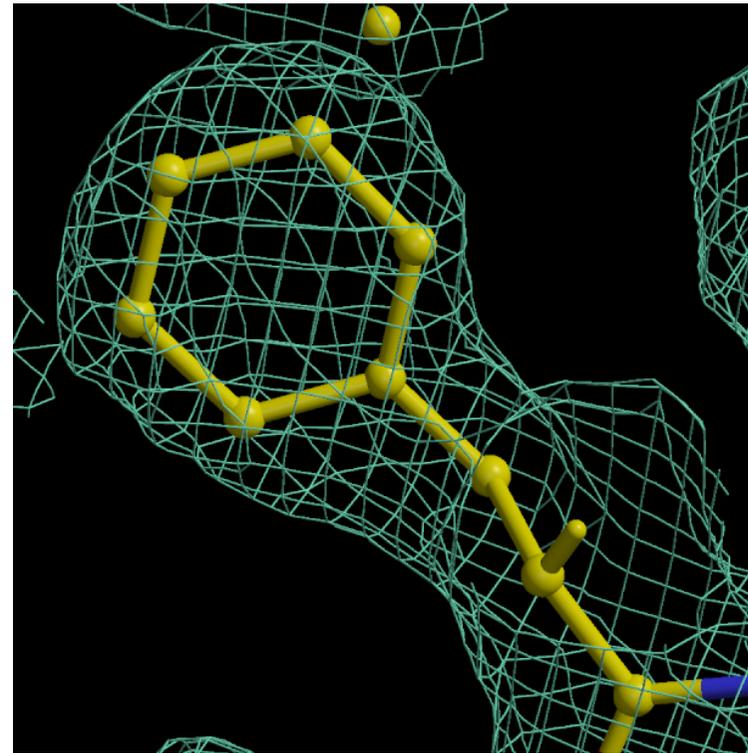

- Thin lines – single atoms
- Bold line - sum of the two atoms

Chemical information: Phe at two different resolutions

- 0.88 Å

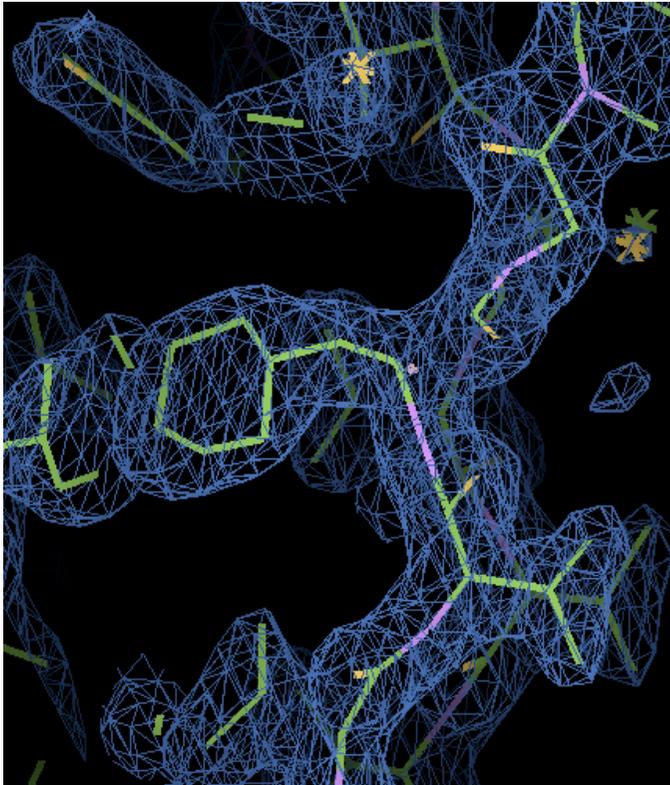

2 Å and High mobility

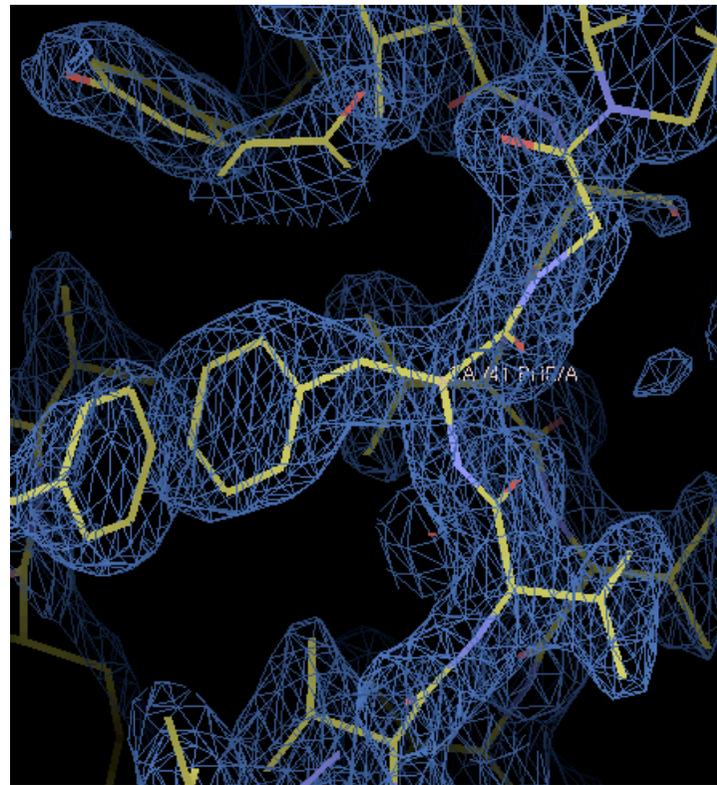

Example

- Data - 1.9Å

Unrestrained

Restrained

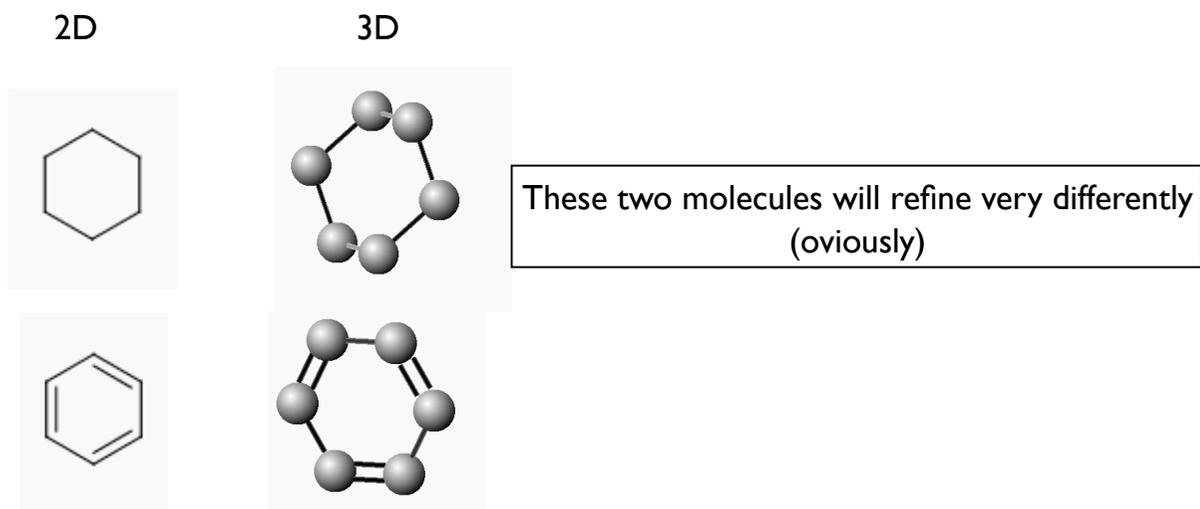

Role of restraints

- When atoms have high B values and/or data are at low resolution then electron density may not show separate peaks
- If restraints would not be used then chemistry of molecule would be unreasonable.
- Role of restraints is to retain chemistry of molecule and at the same time describe electron density optimally.
- If atoms are close to each other it is unlikely that they will have hugely different B values

Using restraints

- Standard dictionary has description of around 10000 small molecules. If one of them is in your crystal then the will be used automatically. In the new version there will be more than 8 000.
- What happens if you have a ligand that is not in the dictionary. Then it is your responsibility to create chemically sensible description.
- Before starting to create a description you need to study bonding structure of your ligand.

Using resources from ccp4

Sketcher is under Refinement/Restraint Preparation/Monomer library sketcher.

The screenshot displays the CCP4 software interface, specifically the Monomer library sketcher. The interface is divided into several panels:

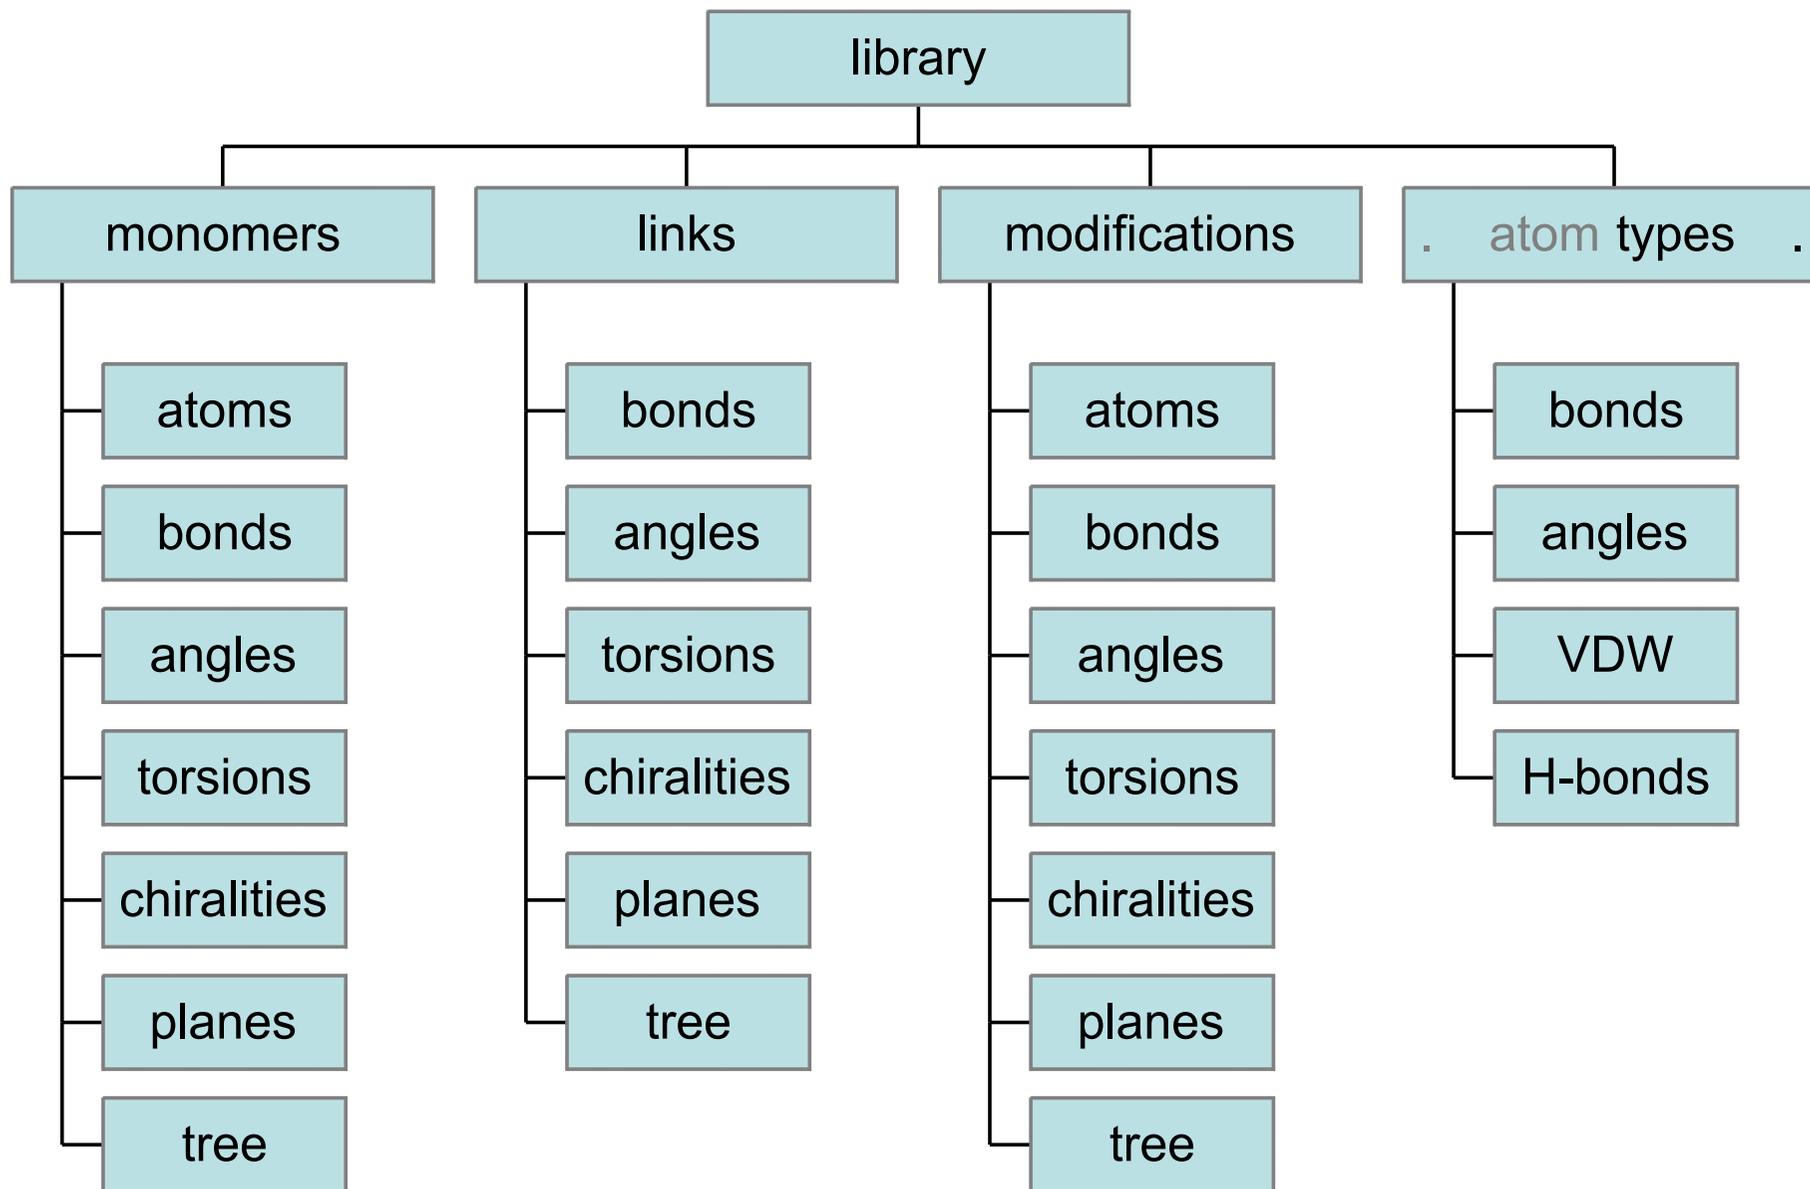

- Top Panel:** Shows the "Refinement" menu and "Project Database Job List - currently no jobs".
- Left Panel:** Contains a list of actions: "Run Refmac5", "Run NCS Phased R", and "Model Completion".
- Center Panel:** Displays a hand-drawn ligand structure on a black background, labeled "Monomer from file".
- Right Panel:** Shows the regularised structure with atoms labeled (C1-C10, H101-H103, H102, H91, H92, C9, H81, H82, H21, H32, H22, H31, H23, H24, H25, H26, H27, H28, H29, H30). Below the structure is a table of coordinates.

Element	Name	Ox

After regularisation

CCP4 library of restraints

Monomers

A *monomer* entry describes an individual compound

CCP4 library contains:

- All amino acids
- All nucleic acids
- Common sugars
- Other organic and inorganic compounds:

in ccp4-6.13	2,500
--------------	-------

in the next ccp4 release (atom names as in PDB-v3)	10,500
---	--------

New monomer

CCP4 tools:

LIBCHECK - uses *atom types*

- creates *monomer* description from molecular graph
- creates coordinates from the monomer description

SKETCHER - GUI for LIBCHECK

MAKECIF - creates restraints for a particular macromolecule

- a separate program wrapping a subset of REFMAC subroutines

Modifications and links

The idea of this mechanism is that

- while *monomer* records describe individual compounds
- *modifications* and *links* describe changes resulted from chemical reactions

Modification formalism allows to change a monomer

Link formalism allows to join modified monomers together

(details later)

CCP4 library contains modifications

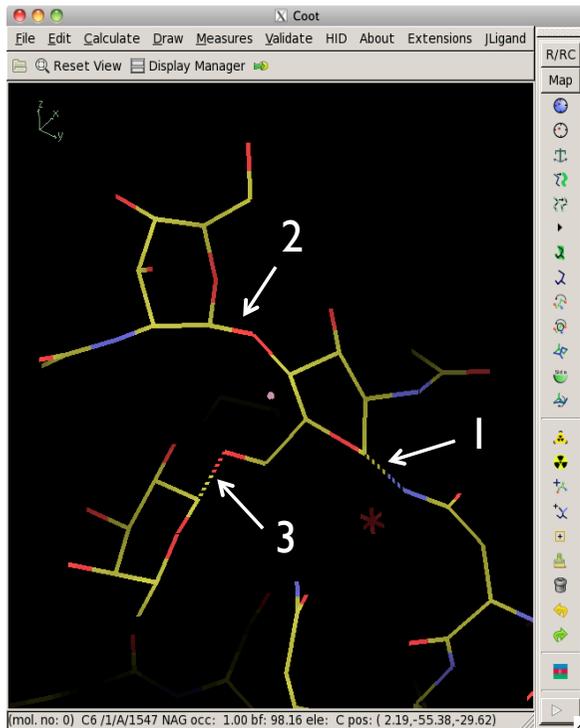

- terminal peptides and nucleotides
- methylated nucleotides
- deprotonated states of some peptide side chains

CCP4 library contains links and corresponding modifications for:

- polypeptide chains (CIS,TRANS), S-S bridges
- polynucleotide chains
- glycosylated proteins

Standard links

2xmb

FAQ: How to create links for glycosylated proteins?

A: For typical glycosylation cases this is not needed.

- necessary modifications and links are there in the standard ccp4 library
- by default REFMAC uses these library descriptions

FUL = Beta-L-Fucose

NAG = N-Acetyl-D-Glucosamine

Standard links used here:

- (1) "NAG-ASN"
- (2) "BETA1-4"
- (3) "BETA1-6"

New links

TYR–TYR covalent link in
M. tuberculosis Hemoglobin O

PDB id 1ngk

When new link descriptions are needed:

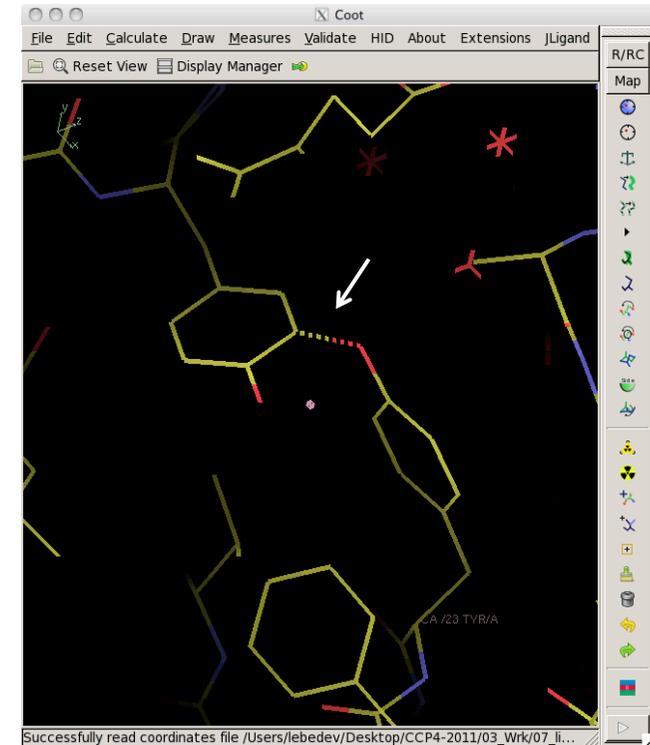

side chain – side chain (e.g. TYR – TYR on the figure)

side chain – main chain (e.g. LYS – Ubiquitin)

side chain – ligand (e.g. LYS – PLP)

JLigand:

- new GUI for LIBCHECK
- descriptions of monomers (functionality of SKETCHER)
- descriptions of links and corresponding modifications

JLigand: a graphical editor to create ligand and link descriptions

Andrey Lebedev, Paul Young, Alexei Vagin, Garib Murshudov

It works with java 1.5 or later versions

New link

Example:

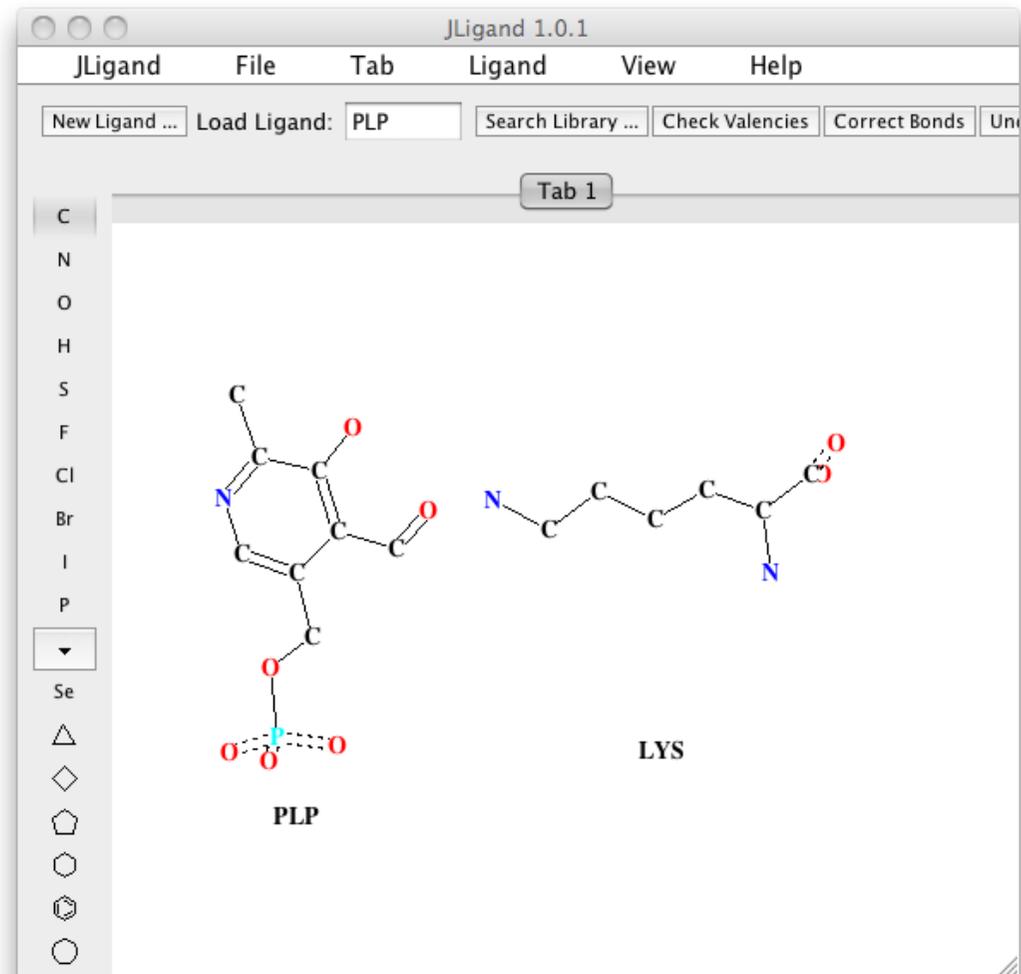

- covalent linkage between LYS and Pyridoxal phosphate (PLP).
- describes PLP forming internal aldimine in aminotransferases.

Given:

- descriptions of LYS and PLP from the standard library

Needed:

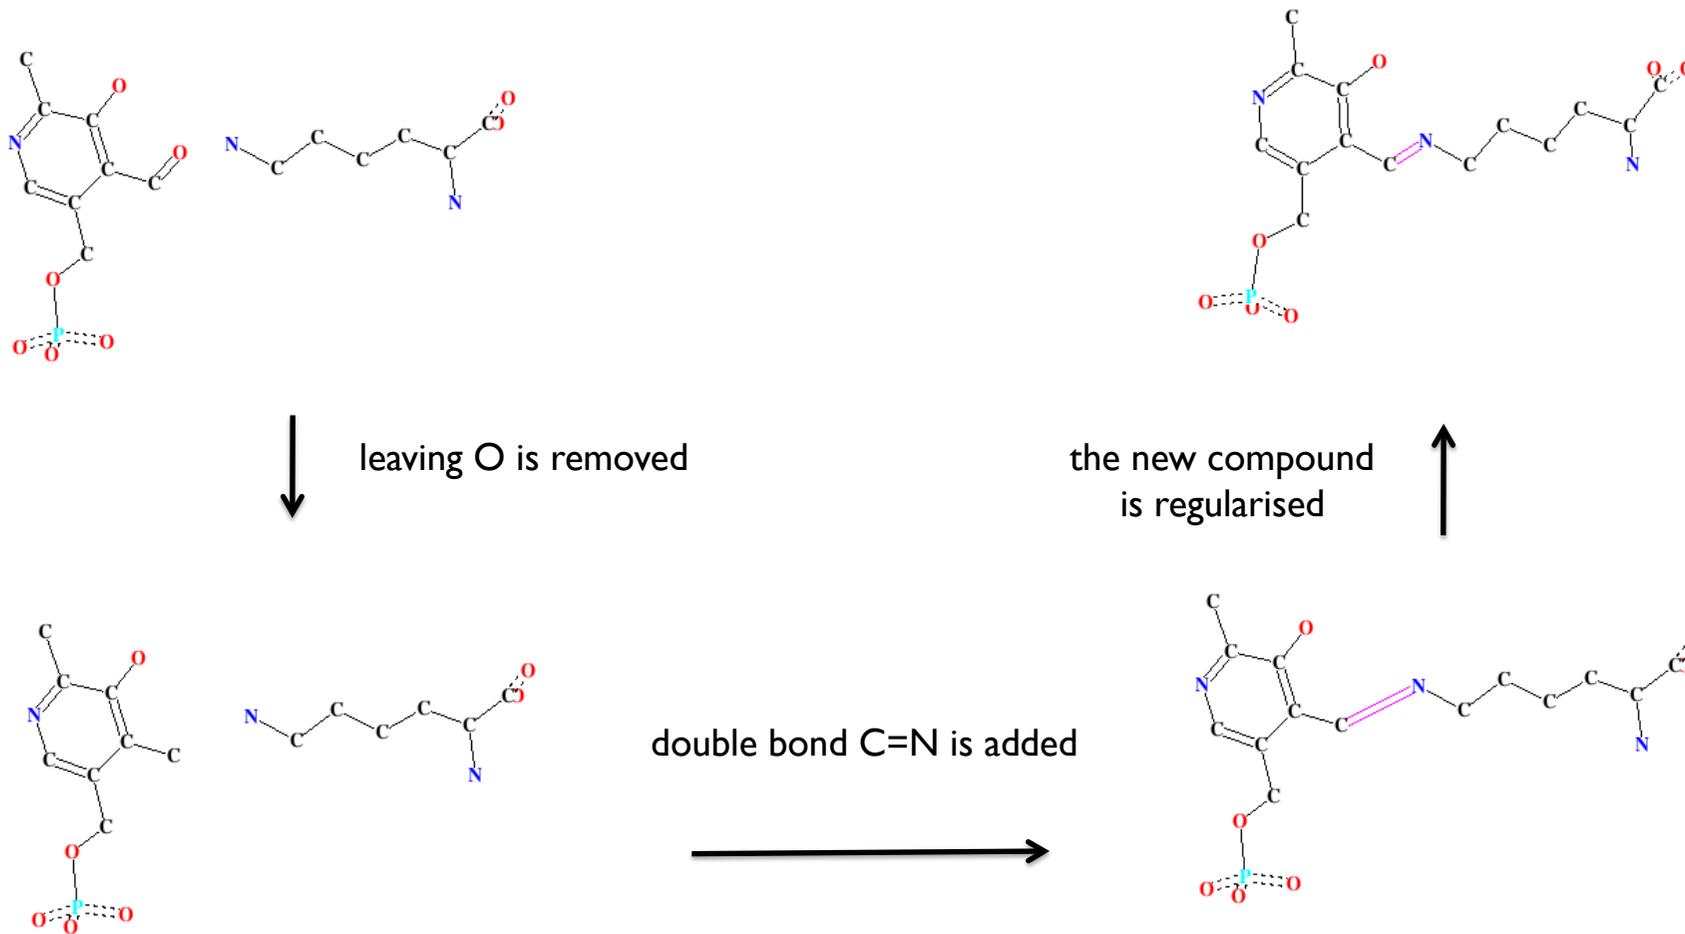

- additional library file with the description of link LYS–PLP

Creating a new link, as seen in JLigand GUI

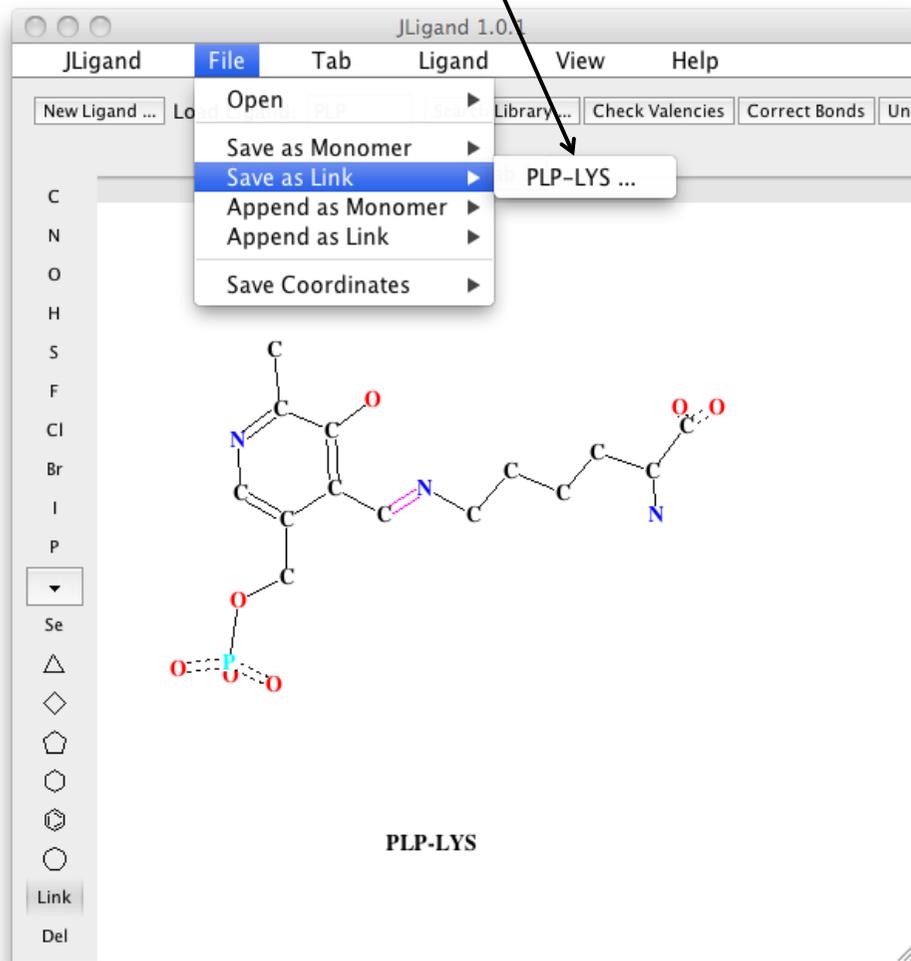

The two monomers are in effect reacted in silico
Hydrogen atoms are dealt with automatically*)

* it is also possible to visualise H-atoms and dealt with them explicitly

The new link, "file view"

To save into CIF-file (additional library)

Contents:

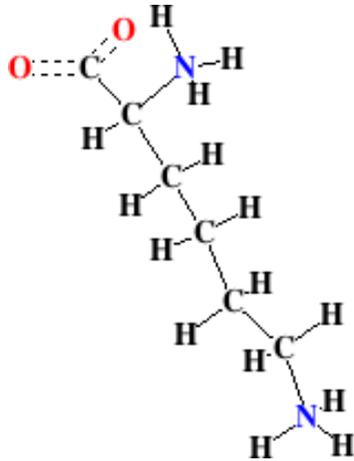

- (1) modification "PLPmod1"
 - (2) modification "LYSmod1"
 - (3) link "PLP-LYS"
- No monomers

```
PLP-LYS
data_mod_list
loop_
  _chem_mod.id
  _chem_mod.name
  _chem_mod.comp_id
  _chem_mod.group_id
  PLPmod1 "PYRIDOXAL-5'-PHOSPHATE" " PLP .
  LYSmod1 'LYSINE' ' LYS .
data_link_list
loop_
  _chem_link.id
  _chem_link.comp_id_1
  _chem_link.mod_id_1
  _chem_link.group_comp_1
  _chem_link.comp_id_2

  _chem_link.group_comp_2
  _chem_link.name
  PLP-LYS PLP PLPmod1 . LYS LYSmod1 .
  PLP-LYS
```

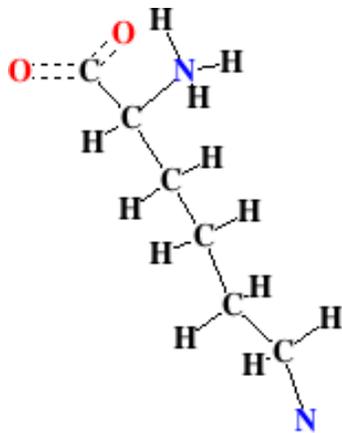

The screenshot shows the contents of the PLP-LYS CIF file. The file is titled 'PLP-LYS'. It contains three main sections: 'data_mod_list', 'data_link_list', and 'loop_'. The 'data_mod_list' section lists two modifications: 'PLPmod1' (PYRIDOXAL-5'-PHOSPHATE) and 'LYSmod1' (LYSINE). The 'data_link_list' section lists a single link named 'PLP-LYS'. The 'loop_' section lists the identifiers for the modifications and the link. Arrows labeled 1, 2, and 3 point to the modification and link entries in the file.

Plane

Regularisation

- The molecular graph of the total compound (not coordinates!) is loaded into LIBCHECK
- LIBCHECK generates target values and sigmas for restraints
- LIBCHECK generates initial coordinates
- REFMAC ("mode newentry", i.e. no X-ray data) refines these initial coordinates using restraints from LIBCHECK
- The linked compound is displayed in JLigand GUI
- On request ("View" or "Save") but not before regularisation, the description of the total compound is split into two modifications and one link
- Descriptions of original non-modified monomers are discarded when they are available from the standard library

Utilising new link description

Good news: there is no need to manually edit the additional CIF-library, even to see its contents. JLigand does the job.

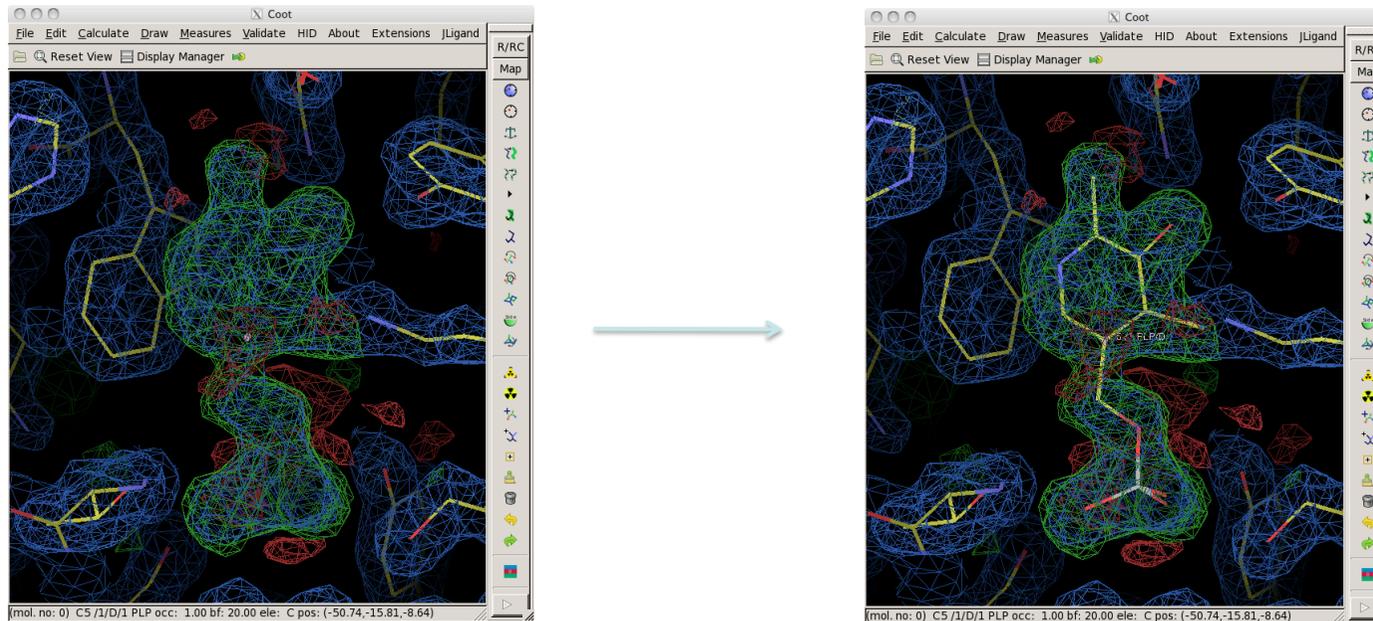

Three remaining steps:

- docking monomer(s) into electron density
- defining link in the pdb-file
- refinement of the structure with linked ligand using additional library

Docking into the electron density

In our example, this is completely independent step: the additional library is not used.

- non-modified monomer is taken from the standard library
- docking is performed, e.g. using coot:

- leaving atoms (O4A of PLP in this example) are removed
- in our example, one of the monomers (LYS) is already in the model

Defining link in the pdb-file

In general case, link cannot be applied automatically.

For example:

- e.g. the same two atoms of the same two compounds can form single or double bond
 - H-atom are not defined in the PDB-file

Therefore REFMAC needs additional instructions:

```
Terminal - vim - 81x14

CCP4 library of restraints

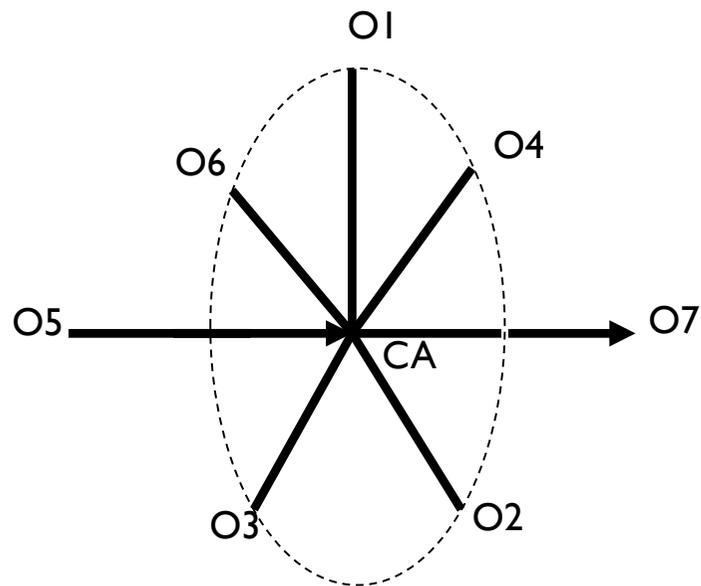

JLigand: new link

JLignad: metal coordination

Metal chiralities in LIBCHECK

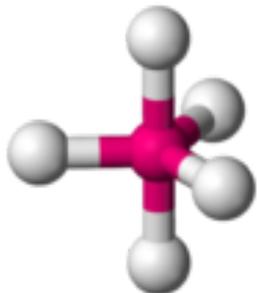

A fragment of CIF-library:

```
loop_  
_chem_comp_chir.comp_id  
_chem_comp_chir.id  
_chem_comp_chir.atom_id_centre  
_chem_comp_chir.atom_id_1  
...  
_chem_comp_chir.atom_id_8  
_chem_comp_chir.volume_sign  
OC7 chir_01 CA O5 O7 O1 O4 O2 O3 O6 . cross5
```

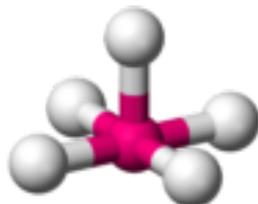

Metal chiralities in LIBCHECK

trigonal
bipyramidal

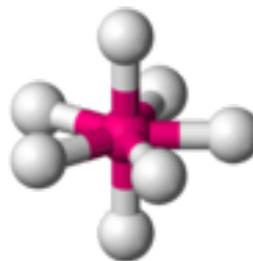

"cross3"

square
pyramidal

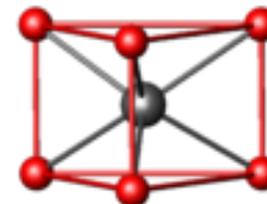

"cross4" with one atom
missing

pentagonal
bipyramidal

"cross5"

trigonal
prismatic

cannot
handle

...

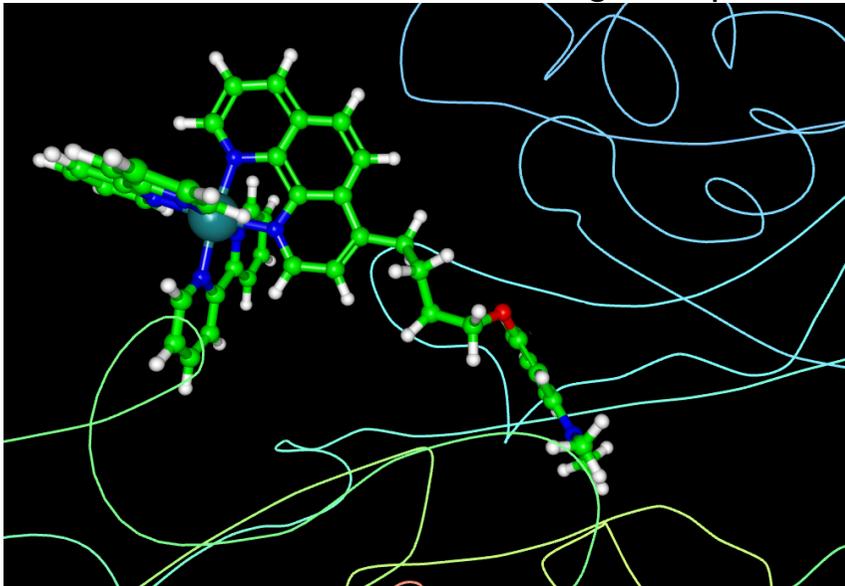

LIBCHECK can generate restraints for some of the coordination geometries:

- from crossX chirality defined in input CIF-file
- from 3D coordinates; this option is used in JLignad.

Example octahedral coordination

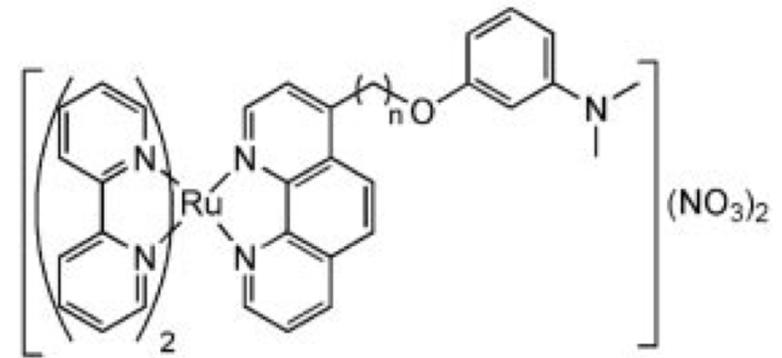

Ruthenium(II) "molecular wire",
an inhibitor of a copper amine oxidase,
PDB code 2BT3

RCSB - Ligand Explorer

3D-editing is essential here

2D representation:

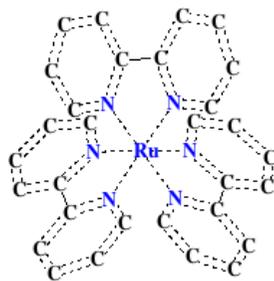

Coordination of Ru is not obvious:
– octahedral?
– trigonal prismatic?

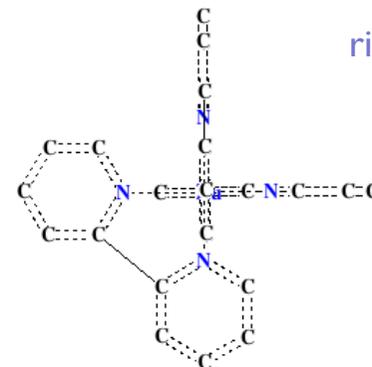

Example of 3-D editing

- Rings have the same Z-value as the atoms to which they are added
- In addition, positions of individual atoms can be adjusted

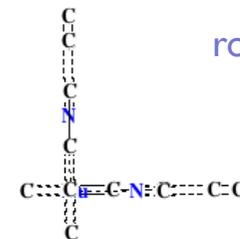

regularised

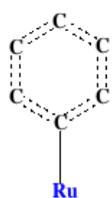

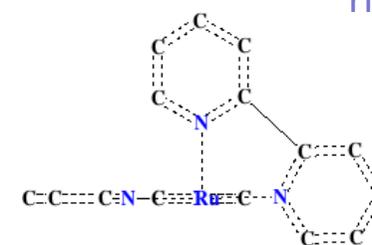

rings added

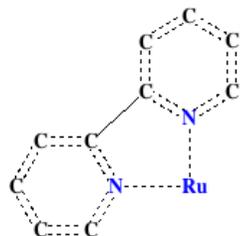

rotated 90o

rings added

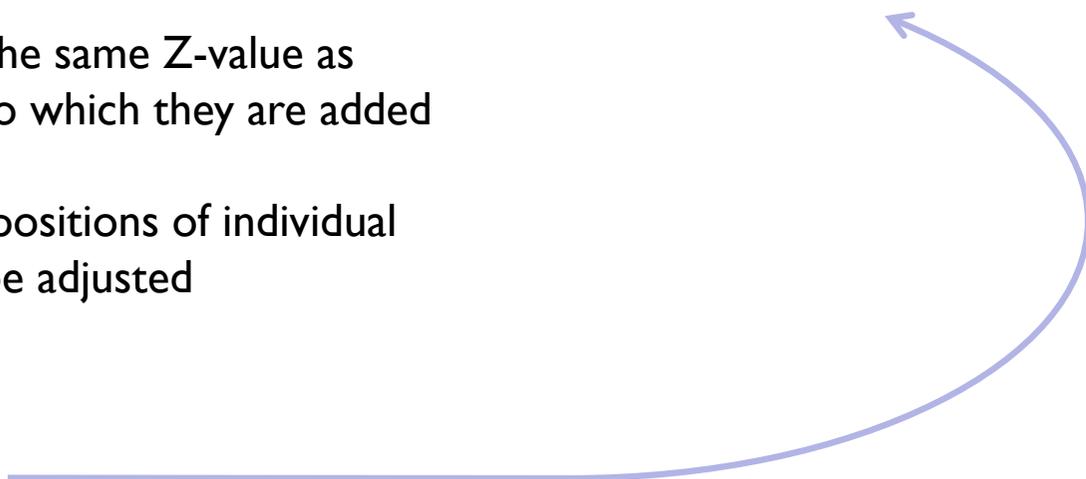

ring added

ring added

rotated 90o

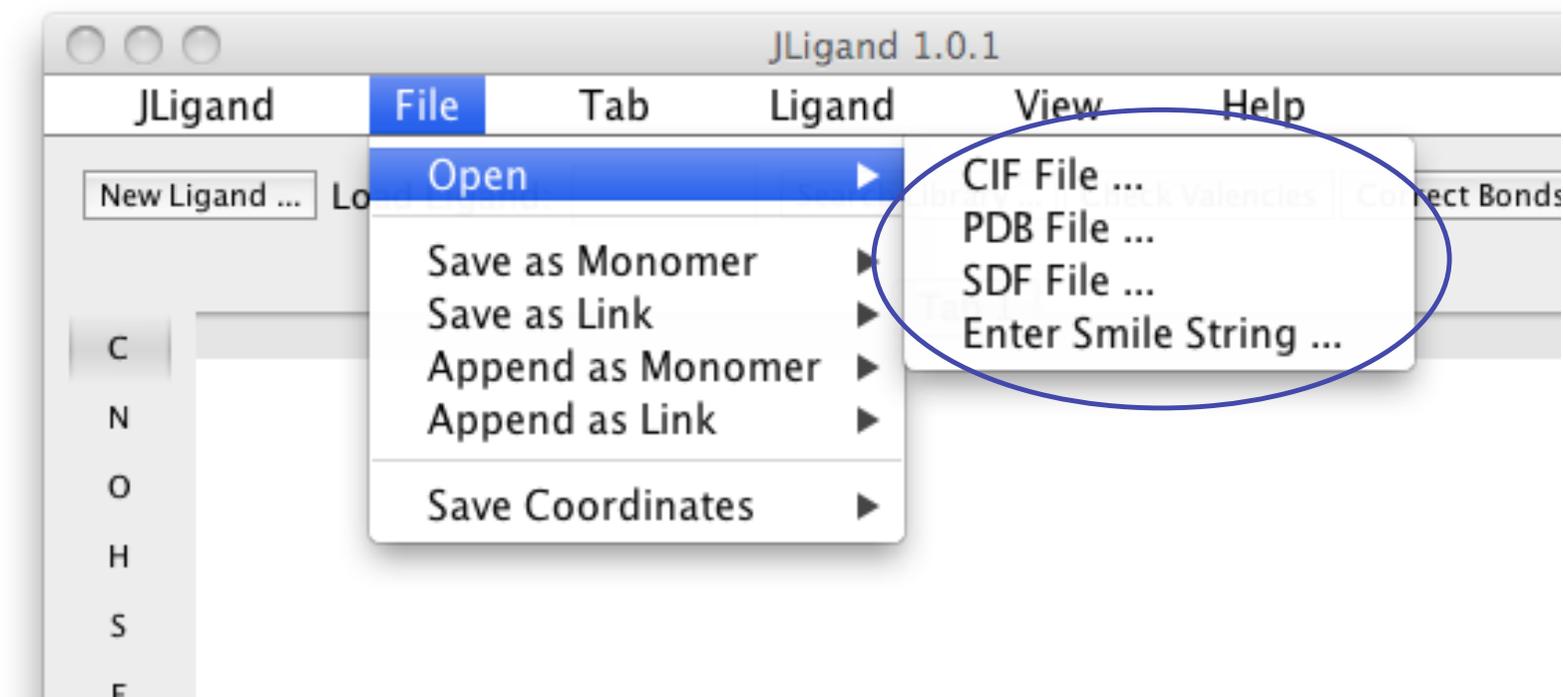

Input formats

The molecular graph for a new ligand can be drawn:

- from scratch as in previous example
- starting from imported molecular graph (mmCIF, SDF, SMILE)
- starting from molecular graph created from imported coordinates (PDB)

As for the most of other tasks, the actual job is done by LIBCHECK while JLigand provides a GUI:

SMILES

SMILES notation is the most popular notation and almost all computational chemical websites, programs use this notation. They can read and write SMILES.

It is based on several simple rules. Full description of SMILES can be find from daylight websites.

<http://www.daylight.com/dayhtml/doc/theory/theory.smiles.html>

SMILES stands for Simplified Molecular Input Line Entry System.

It is concise and widely spread. It is very easy to learn. It was originally designed for manual input using text only editors. SMILES has become as a standard and it is a useful thing to know about.

SMILES

SMILES uses several very simple rules (these rules are sufficient to generate SMILES from structure and structure from SMILES).

Rules:

Atomic symbols used for atoms

Hydrogen atoms as a rule are implicit. They are deduced using valence information about atoms

Neighbouring atoms stand one after another

Single, double, triple and aromatic bonds are denoted using “-”, “=”, “#” and “:” respectively. Single and aromatic bonds are usually not shown.

Branches represented by parentheses

Cycles are added by using matching digits on connecting atoms

Aromatic atoms are denoted using lower cases.

These rules are sufficient to describe most of the cases. Let us consider some examples
